

# GX Settings for Global Applications

## 1. Introduction

Although most GX settings are a matter of personal preference or network configuration some settings alter the size of the windows and fields displayed by application software. The following settings and customisations are **recommended** for running Global 3000 V6.0 on a screen resolution of 1024 \* 768. We expect Global 3000 V6.0 windows to run correctly with these settings. However, other settings (e.g. larger fonts) MAY potentially result in window or field truncation and "clipping" when running Global applications.

## 2. Recommended GX.INI Settings

Most of the GX.INI settings are subject to personal preference. The only setting this is recommended for use with Global 3000 V6.0 is:

```
[general]  
FieldSizeAdjustmentAlgorithm=5
```

## 3. Recommended Font Settings

The font settings are customised via the "Settings" drop-down menu. Global 3000 V6.0 was tested and QC using the following fonts:

```
LabelFont=Tahoma,10,400,Off  
DataFont=Tahoma,10,700,Off  
ButtonFont=Tahoma,10,400,Off
```

## 4. Recommended Field Size Settings

Various field settings are customised via the "Settings" drop-down menu. The "Field sizes" option from this menu allows 3 parameters to be customised. Global 3000 V6.0 was tested and QC using the following parameters:

```
SmallFieldLength=2  
RightJustifiedSmallFieldLength=1  
MaximumApplicableSmallFieldLength=10
```
